

# Greedy algorithms

CMPSC 465 - Yana Safonova

The minimum spanning tree

# Kruskal's algorithm - proof of correctness

**Claim.** A cycle and a cutset intersect in an even number of edges.

Cycle  $C = 1-2, 2-3, 3-4, 4-5, 5-6, 6-1$   
Cutset  $D = 3-4, 3-5, 5-6, 5-7, 7-8$   
Intersection =  $3-4, 5-6$

**Pf.** (by picture)

A cycle has to enter and leave the cut the same amount of times

# Kruskal's algorithm - proof of correctness

**Cut property.** Let  $S$  be any subset of nodes, and let  $e$  be the min cost edge with exactly one endpoint in  $S$ . Then the MST contains  $e$ .

$e$  is in the MST

# The cut property

**Cut property.** Let  $S$  be any subset of nodes, and let  $e$  be the min cost edge with exactly one endpoint in  $S$ . Then the MST contains  $e$ .

# Kruskal's algorithm - proof of correctness

**Cut property.** Let  $S$  be any subset of nodes, and let  $e$  be the min cost edge with exactly one endpoint in  $S$ . Then the MST  $T^*$  contains  $e$ .

Pf. (exchange argument)

- Suppose  $e$  does not belong to  $T^*$ , and let's see what happens.
- Adding  $e$  to  $T^*$  creates a cycle  $C$  in  $T^*$ .
- Edge  $e$  is both in the cycle  $C$  and in the cutset  $D$  corresponding to  $S$   
 $\Rightarrow$  there exists another edge, say  $f$ , that is in both  $C$  and  $D$ .
- $T' = T^* \cup \{e\} - \{f\}$  is also a spanning tree.
- Since  $c_e < c_f$ ,  $\text{cost}(T') < \text{cost}(T^*)$ .
- This is a contradiction. ■

# Kruskal's algorithm - proof of correctness

**Cycle property.** Let  $C$  be any cycle, and let  $f$  be the max cost edge belonging to  $C$ . Then the MST does not contain  $f$ .

$f$  is not in the MST

# The cycle property

**Cycle property.** Let  $C$  be any cycle, and let  $f$  be the max cost edge belonging to  $C$ . Then the MST does not contain  $f$ .

(A, C, D, B)

(A, D, B, C)

(D, E, F)

(E, F, G)

# Kruskal's algorithm - proof of correctness

**Cycle property.** Let  $C$  be any cycle in  $G$ , and let  $f$  be the max cost edge belonging to  $C$ . Then the MST  $T^*$  does not contain  $f$ .

**Pf.** (exchange argument)

- Suppose  $f$  belongs to  $T^*$ , and let's see what happens.
- Deleting  $f$  from  $T^*$  creates a cut  $S$  in  $T^*$ .
- Edge  $f$  is both in the cycle  $C$  and in the cutset  $D$  corresponding to  $S$   
 $\Rightarrow$  there exists another edge, say  $e$ , that is in both  $C$  and  $D$ .
- $T' = T^* \cup \{e\} - \{f\}$  is also a spanning tree.
- Since  $c_e < c_f$ ,  $\text{cost}(T') < \text{cost}(T^*)$ .
- This is a contradiction. ■

# Kruskal's algorithm - proof of correctness

- Consider edges in ascending order of weight.
- Case 1: If adding  $e$  to  $T$  creates a cycle, discard  $e$  according to cycle property.
- Case 2: Otherwise, insert  $e = (u, v)$  into  $T$  according to cut property where  $S$  = set of nodes in  $u$ 's connected component.

Case 1

Case 2

# Kruskal's algorithm - implementation

**Implementation.** Use the **union-find** data structure.

- Build set  $T$  of edges in the MST.
- Maintain set for each connected component.

```
Kruskal( $G, c$ ) {  
  Sort edges weights so that  $c_1 \leq c_2 \leq \dots \leq c_m$ .  
   $T \leftarrow \phi$   
  
  foreach ( $u \in V$ ) make a set containing singleton  $u$   
  
  for  $i = 1$  to  $m$       are  $u$  and  $v$  in different connected components?  
    ( $u, v$ ) =  $e_i$       ↗  
    if ( $u$  and  $v$  are in different sets) {  
       $T \leftarrow T \cup \{e_i\}$   
      merge the sets containing  $u$  and  $v$   
    }  
    ↖ merge two components  
  return  $T$   
}
```

Disjoint sets or union-find sets or  
merge-find sets

# What is a disjoint set?

A data structure that is also known as the **disjoint set** or the **merge-find set**

## Example:

There are 5 people: A, B, C, D, and E.

A is B's friend, B is C's friend, and D is E's friend, therefore, the following is true:

- A, B, and C are connected to each other
- D and E are connected to each other

$\{A, B, C\}$  and  $\{D, E\}$  are two disjoint sets

How can we quickly compute if two people are in the same friend group?

# Disjoint set - description

## Operations:

Union(A, B): Connect two elements A and B

Find(A, B): Find whether the two elements A and B are connected

## Example:

A set of elements  $S = \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$ .

Arr[ ] that is indexed by elements of sets, which are of size N ( $N = 10$ ) is used for the operations of *union* and *find*.

## Assumption:

A and B objects are connected only if  $\text{arr}[A] = \text{arr}[B]$ .

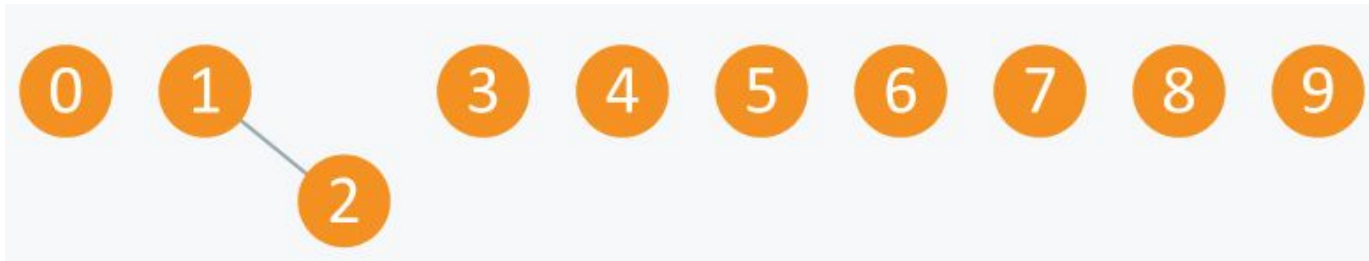

# Disjoint set

The array of representatives

Arr	0	1	2	3	4	5	6	7	8	9
	0	1	2	3	4	5	6	7	8	9

## Disjoint set - Union(2, 1)

Arr

0	1	1	3	4	5	6	7	8	9
0	1	2	3	4	5	6	7	8	9

**Disjoint set - Union(4, 3), Union(8, 4), Union(9, 3)**

Arr	0	1	1	3	3	5	6	7	3	3
	0	1	2	3	4	5	6	7	8	9

## Disjoint set - Union(6, 5)

Arr

0	1	1	3	3	5	5	7	3	3
0	1	2	3	4	5	6	7	8	9

## Disjoint set - 5 disjoint sets

Arr	0	1	1	3	3	5	5	7	3	3
	0	1	2	3	4	5	6	7	8	9

- First subset comprises the elements {3, 4, 8, 9}
- Second subset comprises the elements {1, 2}
- Third subset comprises the elements {5, 6}
- Fourth subset comprises the elements {0}
- Fifth subset comprises the elements {7}

# Disjoint set - find operations

Arr

0	1	1	3	3	5	5	7	3	3
0	1	2	3	4	5	6	7	8	9

- Find(0, 7): 0 and 7 are disconnected: FALSE
- Find(8, 9): Although 8 and 9 are not connected directly, there is a path that connects them: TRUE

## Disjoint set - final representatives

Arr

0	1	1	3	3	5	5	7	3	3
0	1	2	3	4	5	6	7	8	9

# Disjoint set - naive implementation

```
def initialize(Arr, N):  
    for i in range(N):  
        Arr[ i ] = i  
  
# returns true if A and B are connected, else returns  
false  
def find(Arr, A, B):  
    return Arr[ A ] == Arr[ B ]  
    #if Arr[ A ] == Arr[ B ]:  
    #    return True  
    #else:  
    #    return False  
  
#change all entries from Arr[ A ] to Arr[ B ]  
def union(Arr, N, A, B):  
    TEMP = Arr[ A ]  
    for i in range(N):  
        if Arr[ i ] == TEMP:  
            Arr[ i ] = Arr[ B ]
```

# Disjoint set - naive implementation

```
def initialize(Arr, N):  
    for i in range(N):  
        Arr[ i ] = i  
  
# returns true if A and B are connected, else returns  
false  
def find(Arr, A, B):  
    return Arr[ A ] == Arr[ B ]  
    #if Arr[ A ] == Arr[ B ]:  
    #    return True  
    #else  
    #    return False  
  
#change all entries from Arr[ A ] to Arr[ B ]  
def union(Arr, N, A, B):  
    TEMP = Arr[ A ]  
    for i in range(N):  
        if Arr[ i ] == TEMP:  
            Arr[ i ] = Arr[ B ]
```

$O(N)$  and  $O(N^2)$  if applied to all elements

# Kruskal's algorithm + naive disjoint sets

- $M$  is the number of edges
- $N$  is the number of vertices
- The maximum number of  $M$  is  $N(N - 1) / 2$  or  $O(N^2)$
- $O(M) * O(N) = O(N^3)$  - too slow!

```
Kruskal(G, c) {  
    Sort edges weights so that  $c_1 \leq c_2 \leq \dots \leq c_m$ .  
     $T \leftarrow \phi$   
  
    foreach ( $u \in V$ ) make a set containing singleton  $u$   
  
    for  $i = 1$  to  $m$       are  $u$  and  $v$  in different connected components?  
         $(u, v) = e_i$       ↗  
        if ( $u$  and  $v$  are in different sets) {  
             $T \leftarrow T \cup \{e_i\}$   
            merge the sets containing  $u$  and  $v$   
        }  
        ↖ merge two components  
    return  $T$   
}
```

# Disjoint sets

- Stores non-overlapping sets
- $\text{Union}(a, b)$  = merges sets where  $a$  and  $b$  are located
- $\text{Find}(a, b)$  = tells whether or not  $a$  and  $b$  are located in the same set

	Naive implementation
Find	$O(1)$
Union	$O(N)$
Union for all elements	$O(N^2)$

# Optimized disjoint set

Arr	0	1	2	3	4	5
	0	1	2	3	4	5

## Optimized disjoint set - union(0, 1)

# Optimized disjoint set - union(0, 2)

We only change the representative for the old root!

## Optimized disjoint set - union(0, 2)

In the previous implementation,  
Arr would be [2, 2, 2, 3, 4, 5]

## Optimized disjoint set - how to compute the representative of 1?

## Optimized disjoint set - how to compute the representative of 1?

## Optimized disjoint set - how to compute the representative of 1?

# Optimized disjoint set - how to compute the representative of 1?

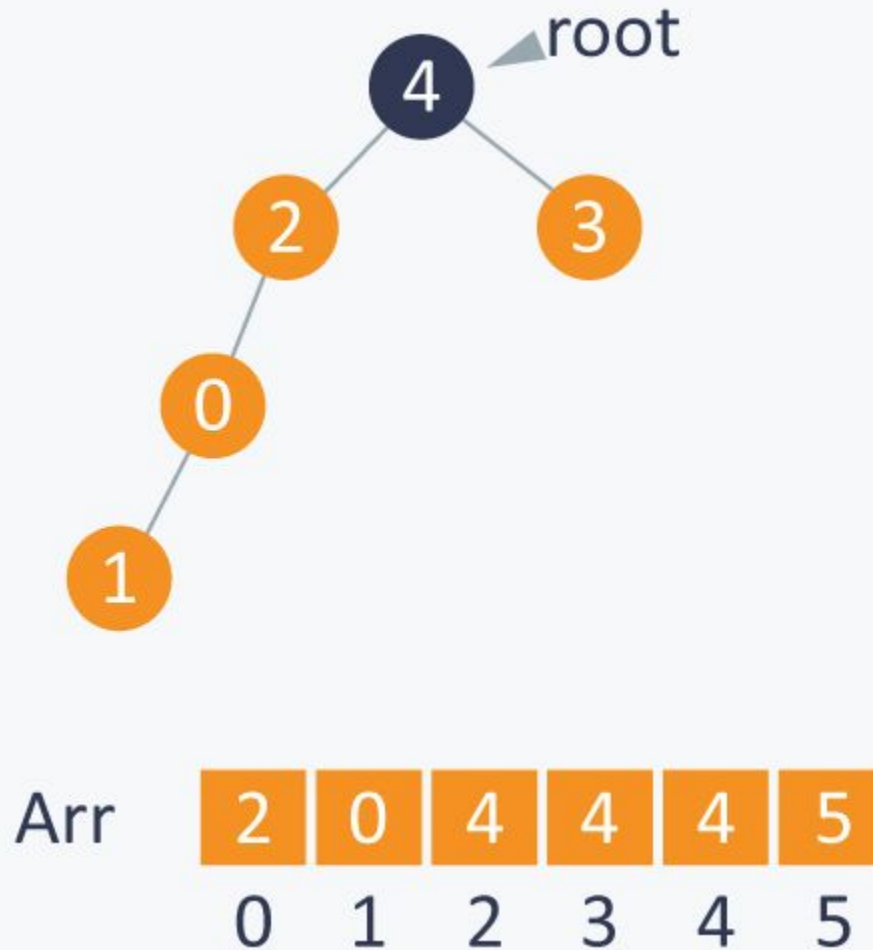

UNION becomes faster  
FIND becomes longer
