

Regular Expressions

Professor: Suman Saha

Regular Expression

Pattern matching

- What happens if, at a Unix/Linux shell prompt, you type

`ls *`

and press return?

- Suppose the current directory contains files called `regfla.tex`, `regfla.aux`, `regfla.log`, `regfla.dvi`, and `regfla.aux`. What happens if you type

`ls *.aux`

and press return?

An alphabet is specified by giving a finite set, Σ , whose elements are called symbols. For us, any set qualifies as a possible alphabet, so long as it is **finite**.

Examples:

- $\Sigma_1 = \{0,1,2,3,4,5,6,7,8,9\}$ – 10-element set of decimal digits.
- $\Sigma_2 = \{a,b,c,\dots,x,y,z\}$ – 26-element set of lower-case characters of the English language
- $\Sigma_3 = \{S \mid S \subseteq \Sigma_1\}$ – 2^{10} -element set of all subsets of the alphabet of decimal digits.

Non-Example:

- $\mathbb{N} = \{0,1,2,3, \dots\}$ – set of all non-negative whole numbers is not an alphabet, because it is **infinite**

String over an Alphabet

A string of length n (≥ 0) over an alphabet Σ is just an ordered n -tuple of elements of Σ , written without punctuation.

- Example: if $\Sigma = \{a, b, c\}$, then a , ab , aac , and $bbac$ are strings over Σ of lengths one, two, three and four respectively
- This string is called sentence or word

N.B. there is a unique string of length zero over Σ , called the null string (or empty string) and denoted ϵ

Regular Language

- A language is a set of strings over an alphabet. Thus
 - $\{a, ab, baa\}$ is a language over $\Sigma = \{a, b\}$
 - $\{0, 111\}$ is a language over $\Sigma = \{0, 1\}$
- The number of symbols in a string is called the length of the string. For a string w its length is represented by $|w|$.
- A **Regular Language** is a subset of all languages that can be defined by **regular expressions**

Regular Expression

- Each regular expression is a notation for a regular language.
- If A is a regular expression, then we write $L(A)$ to the language denoted by A
- *Single character*: 'c'
 - $L('c') = \{ "c" \}$ (for any $c \in \Sigma$)
- *Concatenation*: AB (where A and B are regular expression)
 - $L(AB) = \{ ab \mid a \in L(A) \text{ and } b \in L(B) \}$
 - Example: if $A = 'i'$ and $B = 'f'$ then $L(AB) = L('i' 'f') = \{ "if" \}$
- *Union*:
 - $L(A \mid B) = L(A) \cup L(B)$
 $= \{ s \mid s \in L(A) \text{ or } s \in L(B) \}$
 - Example: $L('if' \mid 'then' \mid 'else') = \{ "if", "then", "else" \}$

Regular Expression

- So far, we do not have a notation for infinite languages
- Iteration: A^*
 - $L(A^*) = \{ "" \mid L(A) \mid L(AA) \mid L(AAA) \mid \dots \}$
 - Example: $L(0^*) = \{ "", "0", "00", "000", \dots \}$
- Epsilon: ϵ
 - $L(\epsilon) = \{ "" \}$
- If (A) is a regular expression same as the regular expression A

Notational Conveniences

- **Regular Definition** is a sequence of the definitions of the form

$$d_1 \rightarrow r_1$$

$$d_2 \rightarrow r_2$$

where d_i is a distinct name and r_i is a regular expression over symbols in

$$\Sigma \cup \{d_1, d_2, \dots, d_{i-1}\}$$

- Example

$$\textit{letter} \rightarrow A | B | \dots | Z | a | b | \dots | z$$

$$\textit{digit} \rightarrow 0 | 1 | \dots | 9$$

$$\textit{id} \rightarrow \textit{letter}(\textit{letter} | \textit{digit})^*$$

Notational Conveniences

- One or more instances: $r^+ = rr^*$
- Zero or one instance: $r? = r | \epsilon$
- Character classes:

$[abc] = a | b | c$

$[a-z] = a | b | \dots | z$

$[0-9] = 0 | 1 | \dots | 9$

- Any single character denoted by dot sign: $.$
- Negated character class: $[\text{^aeiou}]$
- Number of repetition: $[a - f]\{3\}$

Precedence of RE

- The order is (high to low)
 - Closure (*)
 - Concatenation
 - Alternation

Example:

- $ab \mid cd$ means $(ab) \mid (cd)$
- $a \mid bc^*d$ means $(a \mid (b(c^*)d))$

Examples

- Keywords
 - if, while, for,

- Identifiers

$[a-zA-Z_][a-zA-Z0-9_]*$

- Integers

$[+][0-9]^+$

- Whitespace: non-empty sequence of blanks, newlines, tabs
 - $(\backslash n \mid \backslash t \mid ' ')^+$

Examples

- Float

$[+-]? \left(([0-9]^+ \backslash [0-9]^+) ([eE][+-]? [0-9]^+) \right) ?$

- String constants

$\left([a-zA-Z_0-9] | \underline{[a-zA-Z]} \right)^*$

Special Characters in RE

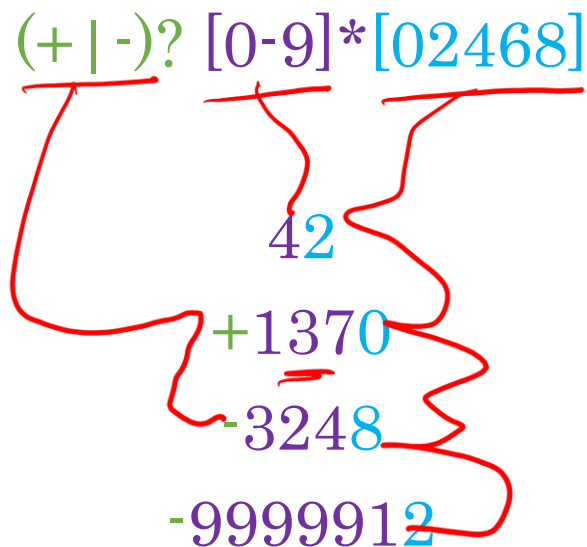

- If you want to match $1+2=3$, you need to use a backslash (\backslash) to escape the $+$ as this character has a special meaning (Match one or more of the previous).
- To match the $1+2=3$ as one string you would need to use $1\backslash+2=3$

$1\backslash+2=3$

Apply Regular Expression

- Suppose our Σ is all ASCII characters.
- A regular expression for even number is

$(+|-)?[0-9]^*[02468]$

42

+1370

-3248

-9999912

Apply Regular Expression

- Suppose our $\Sigma = \{a, @, .\}$ where a represents “some letter.”
- A regular expression for email addresses is

$a^+ (.a^+)^* @ a^+ (.a^+)^+$

Build a Regular Expression

- $L = \{w \mid w \text{ is a binary string which does not contain two consecutive 0s or two consecutive 1s anywhere}\}$
 - E.g., $w = 01010101$ is in L , while $w = 10010$ is not in L
- Goal: Build a regular expression for L
- Four cases for w :
 - Case A: w starts with 0 and $|w|$ is even
 - Case B: w starts with 1 and $|w|$ is even
 - Case C: w starts with 0 and $|w|$ is odd
 - Case D: w starts with 1 and $|w|$ is odd
- Since L is the union of all 4 cases
 - Reg Exp for $L = (01)^* \mid (10)^* \mid 0(10)^* \mid 1(01)^*$ ✓
- If we introduce ϵ then the regular expression can be simplified to:
 - Reg Exam for $L = (\epsilon \mid 1) (01)^* (\epsilon \mid 0)$ ✓

• Regular expression for four cases:

- Case A: $(01)^*$
- Case B: $(10)^*$
- Case C: $0(10)^*$
- Case D: $1(01)^*$

Build a Regular Expression

- $\Sigma = \{a, b, c\}$, a string that has a symbol in the middle that is neither its start nor its end symbol, and its start and end symbols are different, for e.g., `abbbbbc` or `bccccca`

$a c^* b \mid a b^* c \mid b c^* a \mid b a^* c \mid c a^* b \mid c b^* a$

- Given an alphabet $\Sigma = \{a, b\}$, a string with a's followed by b's with both the number of a's and b's being equal.
